

Your Questions, Answered.

We hear these questions often — and they're important. Here's what you need to know before your consultation.

1 "I've already done a lot of testing, including genetics. Do I really need more?"

Not all testing is the same. Inside our integrative oncology program, we focus on two key areas often not fully evaluated in standard care. First, we look at **methylation patterns**, which can indicate how aggressive the cancer may be — giving deeper insight into tumor behavior beyond basic genetics. Second, we perform **comprehensive tumor profiling**. Cancer genetics can shift over time — especially in response to chemo, radiation, or targeted drugs. The genetic makeup of your cancer today may not be the same as months ago. We often recommend ongoing or repeat testing to ensure treatment decisions stay aligned with your current biology.

We're not duplicating what's been done — we're identifying gaps and making sure nothing important is being missed.

2 "Can you coordinate other treatments like infusions or ozone therapy?"

Yes. Our program is fully remote, and **our physicians can coordinate with local providers** in your area for treatments requiring in-person administration — such as IV infusions, ozone therapy, or hyperbaric oxygen. We consult with your local provider on your unique findings and discuss options, while **your local provider prescribes and oversees in-person treatments**. If you don't have an established provider, our team can help research options in your area. Due to the highly specialized nature, availability can be limited. When local options aren't feasible, **our Center of Excellence in Arizona** remains available for patients seeking intravenous and specialized treatments.

You're not limited by geography — we help bring the care to you, or welcome you to our Arizona center when needed.

3 "What if my oncologist doesn't like that I'm adding this to my care?"

This is a common concern, and in many cases it turns out better than patients expect. We've worked alongside oncologists across the country and internationally, helping coordinate care through **peer-to-peer communication** when appropriate. Our team can help educate outside providers on the advanced genetic testing and targeting strategies we use — and we've seen many oncologists become more open when they understand the data behind our approach.

Our goal is always to work alongside your oncologist — not replace them — so you have the most complete care team possible.

4 "What if your testing shows my current treatment isn't the best option?"

It does happen — and when it does, we approach it collaboratively. Our advanced diagnostics, including **pharmacogenomics** and **tumor profiling**, can sometimes reveal that a current treatment may not be the most effective for your biology. If that's the case, **we don't tell you to stop treatment**. We work with you and your oncologist to review the data together, explain the genetic and targeting factors, and support informed decision-making. We can also assist your oncologist with documentation and insights for treatment adjustments or insurance approvals.

Our role is to provide clarity — your medical team remains central in making final decisions.

5 "Can supplements and prescriptions really make a difference in my cancer?"

This goes far beyond standard over-the-counter supplements. We use **physician-grade nutraceuticals** along with targeted prescriptions, all selected based on your individual diagnostic results — including genetics, tumor markers, and immune function. Every recommendation is carefully evaluated for **safety and compatibility**, especially alongside treatments like chemotherapy. We review potential interactions to ensure everything works together appropriately.

These are precision-based interventions designed to support your body and treatment plan in a targeted, clinically informed way — not guesswork.
